The $47,000 LangChain A2A Multi-Agent Infinite Loop - Post-Mortem March 2026

Incident Overview

System: Production market-research pipeline of four LangChain agents communicating via the A2A (Agent-to-Agent) protocol
Incident Date: November 2025 (incident); post-mortem published March 2026
Duration: 264 hours (11 days) before detection
Failure Mode: Verification & Termination Failures + Plan Generation Failures
Impact: $47,000 in API costs accrued before billing dashboards surfaced the problem; no useful work product produced
Technology: LangChain, A2A (Agent-to-Agent) protocol, multiple LLM providers

What Happened

A four-agent LangChain pipeline doing market research entered an undetected feedback loop between two of its agents — an Analyzer and a Verifier — that ran continuously for 264 hours (11 days). During that window, the system spent approximately $47,000 in LLM API costs

If you need an agent validation…

I went to a conference where we were told to follow common best practices to build a secured and governed Agentic architecture.
The core principles were:

* Control the life cycle of APIs, MCPs and Agents: version, retire, same as you would do for APIs.
* Never blindly import unknown MCPs or Skills: control your supply chain end to end.
* Don’t fly blind: add observability so that you can understand token/tools usage and detect abuse.
* Use evaluators to measure the efficiency and reliability of your agents.
* And above all, give an identity to your agent, as you would for a human, and only use fine grain permissions. Never give an agent more permissions than it needs for the task at hand and use humans in the loop to approve sensitive actions.

What do you think?
